GENERAL INFORMATION:

APPLICANT: Lynn Doucette-Stamm et al

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCCOCCUS

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCCOCCUS

TITLE OF INVENTION: BPLIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: GTC-007

CURRENT FILING DATE: 1998-08-13

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/055,779

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A34139	
Concanavalin A precursor - sword bean	
C;Species: Canavalia qladiata (sword bean)	
C; Date: 30-Jun-1991 #sequence revision 30-Jun-1991 #text change 20-10-000	q
C; Accession: A34139; A60636; JO2130	n
R; Yamauchi, D.; Minamikawa, T.	
FEBS Lett. 260, 127-130, 1990	

A;Title: Structure of the gene encoding concanavalin A from Canavalia gladiata and it A;Reference number: A34139; MUID:90127395; PMID:2404793 A;Accession: A34139

A Molecule type: DNA A;Residues: 1-290 <YAM> A;Cross-references: EMBL:X16041; NID:g18009; PIDN:CAA34163.1; PID:g18010 A;Cross-references: EMBL:X16041; NID:g18009; PIDN:CAA34163.1; PID:g18010 B;Yamauchi, D:; Nakamura, K.; Asahi, T.; Minamikawa, T. Plant Cell Physiol. 30, 147-150, 1989 A;Title: Nucleotide sequence of cDNA for concanavalin A from Canavalia gladiata seeds A;Reference number: A60636

formed from its precursor by post-translational cleavage

A;Accession: A60636
A;Status: not compared with conceptual translation
A;Residues: 1-290 c/A2>
A;Experimental source: seed
A;Note: the source was designated as Japanese jack bean
C;Comment: Concanavalin A is formed from its precursor by post-translational cleav
C;Superfamily: plant lectin
C;Superfamily: plant lectin
C;Keywords: calcium; glycoprotein; homotetramer; lectin; manganese
F;1-29/Domain: sipnal sequence #status predicted c5:5148-149/Cleavage site: Asn-Val (unidentified proteinase) #status predicted
F;152/Binding site: carbohydrate (Asn) (covalent) #status predicted
F;163-164/Cleavage site: Asn-Clu (unidentified proteinase) #status predicted
F;281-282/Cleavage site: Asn-Glu (unidentified proteinase) #status predicted

lectin-related storage protein precursor - Cladrastis lutea (fragment)
C.Specios: Cladrasis lutea
C.Specios: Cladrasis lutea
C.Specios: Cladrasis lutea
C.Specios: S66355; S66299
C.Accession: S66355; S66299
C.Accession: S66355; S66299; M.; Bemer, V.; Rouge, P.; van Leuven, F.; Peumans, W.J.
Plant Moll. Biol. 29, 579-598, 1995
A.71tle: A lectin and a lectin related protein are the two most prominent proteins in A.Reference number: S66299; MUID:96123235; PMID:8534854
A.Accession: S66355
A.Status: nucleic acid sequence not shown
A.Molecule type: mRNA
A.Residues: 12-90 (VAN)
A.Cocssion: S66299
A.Accession: S66299
A.Accession: S66299
A:Residues: 30-55;74-176;187-253 <ra>A:Experimental source: seed c.comment: This protein is a leguminous lectin. It interacts with high affinity with te galactosyl residues. C.superfamily: plant lectin C.superfamily: plant section C.superfamily: plant section C.superfamily: signal sequence #status predicted <SIG>F:129yDomain: signal sequence #status predicted <MAT>F:90.142,208,220/Binding site: carbohydrate (Asn) (covalent) #status predicted F:272/pisulfide bonds: Interchain #status predicted
                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

probable lectin 2 precursor - alfalfa

C;Species: Medicago sativa (alfalfa)

C;Species: Medicago sativa (alfalfa)

C;Species: Medicago sativa (alfalfa)

C;Accession: T09620

C;Accession: T09620

R;Brill, L.M.; Pieternel, V.R.

submitted to the EMBL Data Library, March 1998

A;Description: Legume seed lectin genes: sequence of Mslec2 from Alfalfa, Alfalfa and A;Reference number: Z16780

A;Accession: T09620

A;Status: preliminary; translated from GB/EMBL/DDBJ

A;Recure type: DNA

A;Residues: 1-279 <ARI>
A;Residues: 1-279 <ARI>
A;Residues: 1-279 <ARIA

A;Residues: al-279 <ARIA

Nyjeruring in precursor, black locust)

C. Species: Robinia pseudoacacia (black locust)

C. Saccession: S62691, S62686

R. Van Damme, E. J. M.; Barre, A.; Rouge, P.; van Leuven, F.; Peumans, W.J.

Plant Mol. Biol. 29, 1197-1210, 1995

A. Title: The seed lectins of black locust (robinia pseudoacacia) are encoded by two g A. Reference number: S62685; MUID:96191285; PMID:8616218

A. Reference number: S62685; MUID:96191285; PMID:8616218

A. Status: nucleic acid sequence not shown

A. Residues: 1-285 cvAnA

A. Residues: 1-285 cvAnA

A. Residues: 32-50 cvAnA

C. Superfamental source: seed

A. Molecule type: Protein

A. Residues: 32-50 cvAnA

C. Superfamily: plant lectin

C. Keywords: glycoprotein: homotetramer: lectin

1. Biol. Chem. 275:19778-19787(2000).

1. FUNCTION: D-mannose specific lectin.

1. FUNCTION: D-mannose specific lectin.

1. SUBUNIT: Homotetramer.

1. SUBUNIT: Homotetramer.

2. 1- PTM: THE MATURE CHAIN CONSISTS OF RESIDUES 164-281 FOLLOWED BY AMATURE CHAIN CONSISTS OF RESIDUES 164-281 FOLLOWED BY PRANSLATIONAL MODIFICATION AFTER REMOVAL OF THE SIGNAL SEQUENCE: CLEAVAGE AFTER ASN AT POSITIONS 148, 163, AND 281 IS FOLLOWED BY TRANSPORTION AND IGGATION (BY FORMATION OF A NEW PETIDE BOND) OF RESIDUES 164-281 AND 30-148.

2. INSCELLANEOUS: BINDS ONE MANGANESE (OR OTHER TRANSITION METAL) ION SACCIANIDE-BINDING AND CLEAGUALINATING ACTIVITIES.

3. SIMILARITY: BELONGS TO THE LEGUMINOUS LECTIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plant Cell Physiol. 33:125-129(1992).
-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGGUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- SUBUNTT: RPBAIL IS COMPOSED OF TWO POLYPEPTIDES, A AND B, THAT ASSOCIATE INTO FIVE DIFFERENT TETRAMERIC ISOLECTINS. THE A4 COMBINATION IS THE ONLY ONE DEVOLD OF AGGLUTINATION ACTIVITY.

ISOFORM B4 DISPLAYS MAXIMAL AGGLUTINATION ACTIVITY.

-!- TISSUE SPECIFICITY: MOSILY IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK. FEWER IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK. THE LECTIN ACCUMULATES IN THE INNER BARK IN AUTUMN AND WINNER AND DISAPPEARS IN MAY.

"The seed lectins of black locust (Robinia pseudoacacia) are encoded by two genes which differ from the bark lectin genes.";
-! SIBUL: 29:1197-1210(1995).
-! FUNCTION: SEED LECTIN.
-! SUBBUNIT: HOMOTETRAMER.
-! TISSUE SPECIFICITY: EXPRESSION IN SEED.
-! PTW. MOSTLY FOUND IN NON-GITCOSYLATED FORM.
-! SIMILARITY: TO OTHER LEGUMINOUS LECTINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 ST-VVSTFETTFTFQISTPYTSPPGDGLAFFLAPYDTVIPPNSAGNLLGLFPNLNALRNS 120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

I. Williamonose-specific and sugar specifically aggregatable lectin from bark of the Japanese pageda tree (sophora japonica).";
J. Biol. Chem. 266:3146-3133(1991).
I. FUNCTION: MANNOSE/GIUGOSE-BINDING BARK LECTIN. DISPLAYS
HEMAGGLUTINATING ACTIVITY AT PH 5-10, WITH A PH OPTIMUM AT 8-9.
I. FUNCTION: BARK LECTINS ARE STORAGE PROFEIN THAT PROBABLY MAINTAINS
STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE
MOLECULES THAT CAN BIND THETR OWN CARBOHYDRATE SIDE CHAINS. THEY
COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS
INVERTEBRATES OR HERBIYOROUS HIGHER ANIMALS.
I. SUBUNIT: COMPOSED OF FOUR SUBUNITS OF ABOUT 30 KDA WHICH ARE POST-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-MAR-1097 (TrEMBLE. 03, Last sequence update)

UGEO M., OGAMA H., MALSUMOCO I., Seno N.;

"A novel mannose-specific and sugar specifically aggregatable lectin from bark of the Japanese pagoda tree (sophora japonica).";

J. Biol. Chem. 266.3146-3153(1991).

-!- FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS
HEMAGGLUTINATING ACTIVITY. THIS ACTIVITY IS LOST AT PH BELOW 6.

-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURNIG DORMANT PERIOD. SELE-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLAMY'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

-!- SUBUNIT: COMPOSED OF FOUR SUBUNITS OF ABOUT 30 KDA WHICH ARE POST-TRANSLATIONALLY CLEAVED INTO A TWO SMALLER POLYPEPTIDES: AI AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sophora japonica (Japanese pagoda tree).

J. 14.449-456(1997).

-! FUNCTION: BARK LEGUTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS (BY SIMILARITY).

-! SUBUNIT: HOMOTETRAMER OR HETEROTETRAMER OF MAHB AND MALB SUBUNITS.
-! STHILARITY: BELONG TO THE LEGUMINOUS LECTIN FAMILY.
HSSP: P19588: ILUL.

                                                                                            The present sequence is a partial a FRIL (FIKZ/FIL3 tyrosine kinase receptor-interacting lectin) protein. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a rherapeutic treatment. Including radiotherapeutic and/or cherapeutic treatments and an adapterapeutic and/or patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal
                                                                                                                                                                                                                                                                                                                                                         depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lectin derived progenitor cell preservation factor; progenitor cell; hemantopoietic cell; cultured cell preservation; anticancer therapy; myeloablative therapy; sickle-cell anaemia; ablative therapy protection; FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                             The composition is administered to reduce progenitor cell

(anticancer) myeloablative therapy (bone marrow or whole-body irradiation or chemotherapy) to reconstitute the haematopoietic system; enrichment of progenitor cells (e.g. during ex vivo purging of malignant cells); treatment of tissues containing haematopoietic progenitors for subsequent transplant to improve haematopoietic competence; improving transfer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exogenous DNA to progenitor cells (in gene therapy of various haematological disorders, e.g. sickle-cell anaemia); and protection against ablative therapy (to eliminate proliferating cells specifically), followed by re-establishment of differentiation and proliferation of preserved progenitors. The protein, when linked to magnetic beads, may also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                      The present sequence represents a lectin derived progenitor cell preservation factor. The protein is used to preserve unipotent, pluripotent or totipotent progenitor cells, especially haematopoietic cells, and also progenitors from nerve, muscle, skin, gut, bone, kidney, liver, pancreas or thymus. Specific applications are preservation of cultured cells intended for administration after
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 DSAVLTSFDTIINFEISTPYTSRIADGLAFFIAPPDSVI--SYHGGFLGLFPNANTLNNS 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7
                                                                                                                                                                                                                                                                                                                                   reducing the hematopoietic propentor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity alleviates or therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchywal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                  The present sequence represents a FRIL (F1K2/F1t3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or

The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRIL (FIKZ/FIt3 tyrosine kinase receptor-interacting lectin). The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment, including radiotherapeutic to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity of the therapeutic progenitor cell-depleting activity of the therapeutic progenitor cell-depleting activity of the therapeutic gopulation of progenitor cell-depleting activity of the therapeutic gopulation of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of cells, hemangioblasts, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cencer. 2001-441882/47. N-PSDB; AAH42306 Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics

Example 5; Page 81; 173pp; English.

a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangiablasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair

Novel lectins used to produce transgenic Brassica plants which are resistant to insects

Example 2a; Fig 4; 51pp; English.

lectin selected from Con A, modified Con A (see AAY5873) and pea lectin (see AAY58738); transgenic plant cells containing at least copy of the DNA; a new lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, flea beetles of the genus Phyllotreta, and root flies of the genus belia; and a method for protecting a plant against infestation by insects of these genera. The present sequence is that of the concanavalin A (Con A) lectin of jack bean. The present invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least i
